

Reef recovery baseline

Project Tideglass / Six sites / Review edition

FIELD DOSSIER REEF-BASELINE / 01

A promising signal, with limits

Pelagic Labs is a fictional team testing a small reef-restoration program.
Six sites were observed before and after a twelve-week nursery intervention.

This dossier supports a planning exercise. The values are designed to connect notes, workbooks, charts, tasks and source evidence in the Aster demo.

72 > 89%

Nursery survival

12 > 18

Fish per transect

6 sites

A bounded sample

Nursery survival increased from 72% to 89%.

The six-site sample does not establish regional causality.

Review zone: confirm sampling assumptions before approving expansion.

Reef recovery baseline

Project Tideglass / Six sites / Review edition

FIELD DOSSIER REEF-BASELINE / 02

Where recovery is uneven

Every site has the same observation window and a paired before/after record.
 Coverage is illustrative and not a substitute for real field calibration.

Site	Before survival	After survival
Aster Cove	68%	88%
Beacon Shoal	70%	90%
Coral Steps	74%	92%
Drift Garden	72%	87%
Ember Reef	76%	91%
Farwater	72%	86%

Farwater requires a second inspection before expansion.

One successful week is enough to approve every site.

FIELD DOSSIER REEF-BASELINE / 03

Evidence travels with the decision

The workbook contains paired site values, repeated transect measurements, and summary formulas. The source-note table feeds a separate live chart.

Follow the supports relationship into its Evidence dialog. The saved quote remains attached even when the source note or annotation is revised.

Keep the original quote when an interpretation changes.
